

TERA black box TB 01/6/15

Case 1. Adenosquamous carcinoma. A variant of SCC in the oesophagus and managed as such. Need morphological and immunohistochemical evidence of both lines of differentiation

A case of mine submitted for GI EQA

Another case of mine with macro pics

Case 2. Received as adenosquamous carcinoma for OGSMĐT. I think this is an unusual variant of adenocarcinoma, possibly related to oesophageal ducts or showing pilomatrix-like differentiation

Case 3. Gastric polyp showing oxyntic and foveolar differentiation. Most recent sampling suspicious of HGD.

Case 3. Gastric foveolar adenoma

Case 4. Multifocal oncocytic nodular hyperplasia in parotid of a woman with Birt Hogg Dube syndrome

Case 5. Oropharyngeal / Nasopharyngeal Adenoid Cystic carcinoma.

Case 6. Verrucous hyperplasia on the side of the tongue.
